

## **Assessment Evaluation which was given during "Architectural & Networking Concepts " session.**

**Name:** Rudra

**Incubation:** Batch 02

**Date of session:** 15th January, 2026

### **1. PRATIK MALUNJKAR**

**Feedback:** Very well-structured handwritten submission showing strong understanding of SSL/TLS handshake with correct flowchart and terminology. The system architecture diagram is complete and logically designed with clear service separation. Scaling explanation is detailed, practical, and shows awareness of infrastructure-level trade-offs.

**Any areas of improvement:** Could improve presentation by adding a short-written summary for the architecture section and mentioning modern TLS variants or security best practices.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 5**

### **2. SUPRIYA NANEKAR**

**Feedback:** Provides a clear and well-structured explanation of the SSL/TLS handshake with accurate terminology. The system design explanation is complete and logically laid out, covering frontend, backend services, and databases. Scaling strategy is correct and well justified for a sudden traffic surge.

**Any areas of improvement:** Could improve by adding a brief discussion on monitoring, logging, or handling failed payment retries.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

### **3. VIJAYKUMAR LAD**

**Feedback:** Provides a technically sound and well-explained SSL/TLS handshake with correct terminology. The system architecture explanation is clear, especially in highlighting microservices separation for booking and payments. The scaling strategy is well thought out and shows good awareness of elasticity and fault tolerance.

**Any areas of improvement:** Could add a brief mention of stateless services or caching to demonstrate more production-level thinking.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4.5**

#### 4. SAKSHI DESAI

**Feedback:** Shows clear understanding of the SSL/TLS handshake with correct explanation of negotiation, authentication, and key exchange. The system architecture diagram is neat, logical, and includes all required components with good separation of booking and payment services. Scaling concepts are explained correctly with a clear preference for horizontal scaling.

**Any areas of improvement:** Could add more depth by mentioning real-world considerations such as caching, database replication, or handling partial failures during peak traffic.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

#### 5. HARSHVARDHAN DESAI

**Feedback:** Very strong submission with well-structured and technically accurate explanations across all sections. SSL/TLS handshake is explained clearly and precisely. The system design shows good architectural thinking with proper roles for API Gateway and microservices. Scaling strategies are explained in depth with clear trade-offs.

**Any areas of improvement:** Could optionally include additional components like caching or message queues to demonstrate advanced scalability thinking.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 5**

#### 6. SIDDHARTH ZALAKE

**Feedback:** Shows good conceptual understanding of SSL/TLS and system design fundamentals. The architecture diagram is clean and includes all required components with correct request flow. The scaling explanation is straightforward and technically correct.

**Any areas of improvement:** Could add more depth in the scaling section by mentioning auto-scaling triggers or stateless service requirements.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

#### 7. SHITAL PATIL

**Feedback:** Demonstrates good conceptual clarity on SSL/TLS and explains the handshake steps in a structured manner. The architecture design clearly avoids a monolithic approach and shows understanding of service isolation and database separation. Scaling strategy is correct and well justified.

**Any areas of improvement:** The explanation is mostly descriptive. Adding examples of auto-scaling or mentioning monitoring/alerts would strengthen the practical aspect.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

## **8. MIDHUN MOHANDAS**

**Feedback:** Well-written and technically accurate across all parts. SSL/TLS handshake explanation is structured and complete. The system design clearly explains request flow and service responsibilities. Scaling strategies are well thought out, with clear reasoning and real-world relevance.

**Any areas of improvement:** Could enhance the architecture section by mentioning resilience patterns such as retries, circuit breakers, or database replication.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4.5**

## **9. VAISHNAVI TANDEL**

**Feedback:** Shows a strong and well-structured understanding of the SSL/TLS handshake with clear explanations of negotiation, authentication, and key exchange. The system architecture is detailed and includes both a high-level view and a clear request flow, showing good architectural thinking. The scaling strategy is well reasoned and correctly favors horizontal scaling for burst traffic.

**Any areas of improvement:** Could mention database-level scaling or replication explicitly instead of referring to a centralized database to strengthen fault-tolerance discussion.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 5**

## **10. ATUL DUBAL**

**Feedback:** Shows solid conceptual understanding of SSL/TLS with clear and structured explanations. The system architecture is complete and logically laid out, covering DNS, load balancing, API Gateway, microservices, and databases. The scaling strategy is correctly chosen and justified with clear reasoning aligned to real-world production systems.

**Any areas of improvement:** The submission is slightly repetitive in places. Adding a concise summary or highlighting trade-offs more explicitly would improve clarity.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4.5**

## **11. AJAY KHOT**

**Feedback:** Shows good foundational understanding of SSL/TLS and system architecture fundamentals. The QuickMyShow architecture is clean and covers the essential components required to handle high traffic. The scaling explanation is straightforward and technically correct.

**Any areas of improvement:** The submission is mostly descriptive. Adding a bit more depth on auto-scaling, monitoring, or failure handling would improve overall quality.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 3.5**

## **12. AARYA DARNE**

**Feedback:** Demonstrates clear conceptual understanding of SSL/TLS and explains the handshake in a simple, easy-to-follow manner. The system architecture diagram is complete and logically structured. Scaling strategy is correct and appropriately justified for handling sudden high traffic.

**Any areas of improvement:** The architecture explanation could be expanded slightly to cover service isolation at the database level or handling concurrent seat locking.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

## **13. JAID MULLA**

**Feedback:** Explains SSL/TLS concepts in a simple, intuitive manner that shows good foundational understanding. The system architecture explanation is practical and easy to follow, especially in explaining why microservices separation matters. Scaling decision is correct and justified well for burst traffic.

**Any areas of improvement:** The explanation is more conceptual than technical. Could improve by using more precise terminology and adding a bit more technical depth.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 3.5**

## **14. BHUSHAN TAWADE**

**Feedback:** Very strong submission with clear and detailed understanding of the SSL/TLS handshake, including correct mention of client/server randoms, premaster secret, and session key generation. The system architecture is well thought out and goes beyond the basics by including multiple microservices (user, notification, movie) and separate databases. The scaling strategy is explained in depth, with a mature comparison of vertical vs. horizontal scaling and clear reasoning for the final choice.

**Any areas of improvement:** Could briefly mention how seat locking or idempotent payment handling would be managed during retries in high traffic scenarios.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 5**

## **15. PRUTHVIRAJ PATIL**

**Feedback:** Explains SSL/TLS concepts in a simple and intuitive way, making it easy to understand even for non-technical readers. The QuickMyShow architecture explanation is clear and practical, with good use of analogies. Scaling decision is correct and justified well for burst traffic.

**Any areas of improvement:** Could improve technical depth by using more precise terminology and expanding slightly on database or service-level scaling.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

#### 16. GOURI SUTAR

**Feedback:** Shows good conceptual clarity on SSL/TLS and explains the handshake steps accurately. The architecture diagram covers the required components and demonstrates understanding of traffic distribution and service separation. The scaling explanation is logically sound and aligned with real-world scenarios.

**Any areas of improvement:** The system design explanation is slightly high-level. More detail on data flow between services and justification for design choices would strengthen the answer.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

#### 17. VAIBHAV CHOUGULE

**Feedback:** Demonstrates good understanding of the SSL/TLS handshake with accurate explanation of negotiation, authentication, and key exchange. The system architecture is well-designed and slightly more advanced than average, including an additional recommendation service. Scaling strategy is correct and aligns well with real-world high-traffic systems.

**Any areas of improvement:** Could explicitly mention which services are critical during peak booking (booking/payment) and which can be deprioritized to improve resilience.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

#### 18. OMKAR GORE

**Feedback:** Strong and slightly advanced system design compared to peers. SSL/TLS explanation is accurate and complete. The architecture includes additional services like a recommendation engine, showing good system thinking beyond minimum requirements. Scaling strategy is clearly reasoned and aligned with high-traffic scenarios.

**Any areas of improvement:** Could briefly explain why additional services (like recommendations) are not on the critical booking path during peak load.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

#### 19. AMAN MOMIN

**Feedback:** Shows a strong and well-structured understanding of the SSL/TLS handshake with clear explanations of negotiation, authentication, and key exchange. The system architecture is detailed and includes both a high-level view and a clear request flow, showing good architectural thinking. The scaling strategy is well reasoned and correctly favors horizontal scaling for burst traffic.

**Any areas of improvement:** Could mention database-level scaling or replication explicitly instead of referring to a centralized database to strengthen fault-tolerance discussion.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 5**

## 20. SHITAL PHADAKE

**Feedback:** Clear and structured explanation of SSL/TLS handshake steps with correct technical flow. The system design covers all required components and demonstrates understanding of microservices, API Gateway responsibilities, and service isolation. Scaling strategy is explained logically and correctly.

**Any areas of improvement:** The architecture explanation could benefit from a clearer data-flow narrative and mention of database scaling or replication strategies.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

## 21. MISBA SHAIKH

**Feedback:** Demonstrates a clear understanding of SSL/TLS handshake concepts with correct explanation of negotiation, authentication, and key exchange. The system architecture is well-structured, includes all required components, and follows a logical microservices flow. Scaling strategies are explained clearly with correct reasoning for choosing horizontal scaling in high-traffic scenarios.

**Any areas of improvement:** Could improve depth by briefly mentioning modern TLS mechanisms (like Diffie-Hellman) and adding more detail on database scaling or fault tolerance.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 4**

## 22. SHREYA MANIKERI

**Feedback:** Strong submission with a well-detailed SSL/TLS explanation broken into clear phases. The system architecture goes beyond minimum expectations by including multiple backend services and external integrations. Scaling strategy is detailed, realistic, and shows good infrastructure awareness.

**Any areas of improvement:** Could briefly justify why additional services should not be on the critical payment path during peak traffic.

**Rate the assessment 1 to 5 (1 lowest to 5 highest): 5**
